CYCLOMATIC COMPLEXITY

Aim

To determine the cyclomatic complexity of a simple program using a decision statement in RAPTOR**.**

Algorithm

1. Start.
2. Assign a = 10 and b = 20.
3. Calculate c = a + b.
4. Check the condition c > 25.
5. If the condition is True, set c = c + 5; otherwise, set c = c - 5.
6. Display the value of c.
7. Calculate cyclomatic complexity using the formula:
   - Cyclomatic Complexity = Number of Decision Nodes + 1
8. Stop.

Sample Input

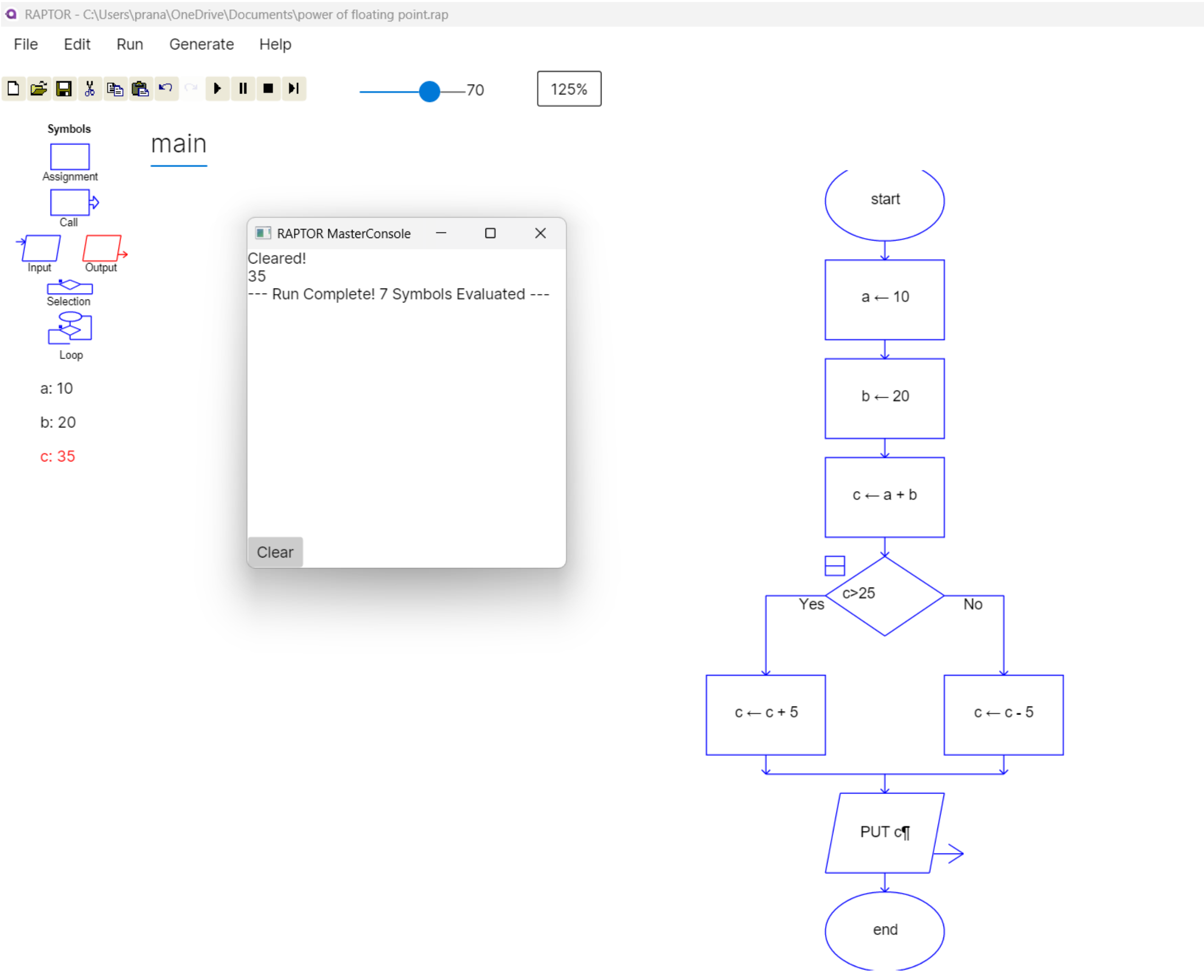
a = 10

b = 20

Sample Output

Output = 35

Cyclomatic Complexity = 2



Result

The program output is 35, and the Cyclomatic Complexity of the flowchart is 2 because it contains one decision node.
